

Please amend claims 1, 5, 7, 9, and 11 as follows:

1. (Amended) A system for detecting the level of liquid in a vessel, comprising:

a detector assembly including

a thermally conductive substrate,

a heater mounted on said substrate such that said heater is

thermally coupled to the interior of the vessel, said

heater being able to be actuated to add heat to the

surface of the substrate thermally coupled to the

interior of the vessel, and

a sensor mounted on said substrate in proximity to said heater

such that discrete elevations of the interior of the

vessel are thermally coupled to corresponding

longitudinal portions of said sensor to generate an

electrical signal defining a temperature signal, said

correspondence being incrementally continuous such that

the elevations corresponding to said portions of said

sensor increase from one to the other of the ends of said

sensor, said sensor being able to be actuated to detect

the temperature in the vessel in proximity to the sensor

indicative of the temperature detected by said sensor,

said sensor having a vertical dimension sufficiently

large such that said temperature signal will vary in

proportion to said longitudinal portion of said sensor

thermally coupled to the liquid;

a processor electrically connected to said sensor for

receiving said temperature signal after actuation of said

heater, said processor being programmed to use said

temperature signal to calculate the elevation of the

upper surface of the liquid in the vessel thereby to

generate an electrical signal defining an elevation

signal indicative of the elevation of the liquid upper surface relative to the lower end of said sensor;
 an interface electrically connected to said processor for receiving said elevation signal for use as the basis for communicating to the user the elevation of the liquid upper surface; and
 a power supply electrically connected to said heater, sensor, processor, and interface, and wherein said sensor comprises a variable resistance means wherein the resistance to electrical conductivity of said sensor varies in proportion to the temperature detected by it, said temperature signal being of a magnitude proportional to the magnitude of the resistance, said programming of said processor comprising using said temperature signal to measure said resistance of said sensor, said programming further comprising using said resistance to calculate the elevation of the upper surface of the liquid.

5. (Amended) A system for detecting the level of liquid in a vessel, comprising:
 a detector assembly including
 a thermally conductive substrate,
 a heater mounted on said substrate such that said heater is thermally coupled to the interior of the vessel, said heater being able to be actuated to add heat to the surface of the substrate thermally coupled to the interior of the vessel, and
 a sensor mounted on said substrate in proximity to said heater such that discrete elevations of the interior of the vessel are thermally coupled to corresponding longitudinal portions of said sensor to generate an

electrical signal defining a temperature signal, said correspondence being incrementally continuous such that the elevations corresponding to said portions of said sensor increase from one to the other of the ends of said sensor, said sensor being able to be actuated to detect the temperature in the vessel in proximity to the sensor indicative of the temperature detected by said sensor, said sensor having a vertical dimension sufficiently large such that said temperature signal will vary in proportion to said longitudinal portion of said sensor thermally coupled to the liquid;

a processor electrically connected to said sensor for receiving said temperature signal after actuation of said heater, said processor being programmed to use said temperature signal to calculate the elevation of the upper surface of the liquid in the vessel thereby to generate an electrical signal defining an elevation signal indicative of the elevation of the liquid upper surface relative to the lower end of said sensor;

an interface electrically connected to said processor for receiving said elevation signal for use as the basis for communicating to the user the elevation of the liquid upper surface; and

a power supply electrically connected to said heater, sensor, processor, and interface, and wherein said sensor comprises a potentiometer wherein the resistance to electrical conductivity of said sensor varies in proportion to the temperature detected by it, said temperature signal being equal to said resistance, said programming of said processor comprising using said temperature signal to measure said resistance of said sensor, said programming further comprising using said

resistance to calculate the elevation of the liquid upper surface,

wherein said sensor comprises a potentiometer wherein the resistance to electrical conductivity of said sensor varies in proportion to the temperature detected by it, said temperature signal being equal to said resistance, said programming of said processor comprising using said temperature signal to measure said resistance of said sensor, said programming further comprising using said resistance to calculate the elevation of the liquid upper surface,

wherein said sensor is defined by an intermediate sensor, said system further comprising: an upper sensor mounted on said substrate adjacent to the upper end of said intermediate sensor; and a lower sensor adjacent to the lower end of said intermediate sensor, said upper and lower sensors being thermally coupled to the interior of the vessel to detect the respective temperatures therein in proximity to said upper and lower sensors, said upper and lower sensors being able to be actuated to produce respective electrical signals defining temperature signals indicative of the respective temperatures detected by them, said upper and lower sensors each comprising a potentiometer wherein the resistance to electrical conductivity of each of said upper and lower sensors varies in proportion to the respective temperatures detected by them, said temperature signals of said upper and lower sensors being equal to said respective resistance values thereof, said processor being further programmed to calculate the distance between said lower sensor and the liquid upper surface

according to the following equation:

$$l = \frac{R_i - R_{vp}}{R_{lq} - R_{vp}}$$

where l = longitudinal fraction of said intermediate sensor below said liquid upper surface;

R_i = resistance of said intermediate sensor;

R_{vp} = resistance of said upper sensor when exposed to vapor only; and

R_{lq} = resistance of said lower sensor when exposed to liquid only,

said processor being further programmed to calculate the vertical component of "l" for use as the basis for said generation of said elevation signal.

7. (Amended) A system for detecting the level of liquid in a vessel, comprising:

a detector assembly including

a thermally conductive substrate,

a heater mounted on said substrate such that said heater is thermally coupled to the interior of the vessel, said heater being able to be actuated to add heat to the surface of the substrate thermally coupled to the interior of the vessel, and

a sensor mounted on said substrate in proximity to said heater such that discrete elevations of the interior of the vessel are thermally coupled to corresponding longitudinal portions of said sensor to generate an electrical signal defining a temperature signal, said correspondence being incrementally continuous such that the elevations corresponding to said portions of said sensor increase from one to the other of the ends of said sensor, said sensor being able to be actuated to detect the temperature in the vessel in proximity to the sensor

indicative of the temperature detected by said sensor, said sensor having a vertical dimension sufficiently large such that said temperature signal will vary in proportion to said longitudinal portion of said sensor thermally coupled to the liquid;

B2
GB
WHL
a processor electrically connected to said sensor for receiving said temperature signal after actuation of said heater, said processor being programmed to use said temperature signal to calculate the elevation of the upper surface of the liquid in the vessel thereby to generate an electrical signal defining an elevation signal indicative of the elevation of the liquid upper surface relative to the lower end of said sensor;

an interface electrically connected to said processor for receiving said elevation signal for use as the basis for communicating to the user the elevation of the liquid upper surface;

a power supply electrically connected to said heater, sensor, processor, and interface, and wherein said sensor comprises a potentiometer wherein the resistance to electrical conductivity of said sensor varies in proportion to the temperature detected by it, said temperature signal being equal to said resistance, said programming of said processor comprising using said temperature signal to measure said resistance of said sensor, said programming further comprising using said resistance to calculate the elevation of the liquid upper surface,

wherein said sensor comprises a potentiometer wherein the resistance to electrical conductivity of said sensor varies in proportion to the temperature detected by it, said temperature signal being equal to said resistance,

said programming of said processor comprising using said temperature signal to measure said resistance of said sensor, said programming further comprising using said resistance to calculate the elevation of the liquid upper surface,

wherein said sensor is defined by an intermediate sensor, said system further comprising: an upper sensor mounted on said substrate adjacent to the upper end of said intermediate sensor; and a lower sensor adjacent to the lower end of said intermediate sensor, said upper and lower sensors being thermally coupled to the interior of the vessel to detect the respective temperatures therein in proximity to said upper and lower sensors, said upper and lower sensors being able to be actuated to produce respective electrical signals defining temperature signals indicative of the respective temperatures detected by them, said upper and lower sensors each comprising a potentiometer wherein the resistance to electrical conductivity of each of said upper and lower sensors varies in proportion to the respective temperatures detected by them, said temperature signals of said upper and lower sensors being equal to said respective resistance values thereof, said processor being further programmed to calculate the distance between said lower sensor and the liquid upper surface according to the following equation:

$$l = \frac{R_i - R_{vp}}{R_{1q'} - R_{vp'}}$$

Where l = number of increments between a lower end of said intermediate sensor and the liquid upper surface;

L = total number of increments between an upper end and said lower end of said intermediate sensor

B2
B3
Cnld

(any number of increments are possible, higher number increases resolution of calculation and the actual count is arbitrary and determined only by resolution requirements);

R_i = resistance of said intermediate sensor;

R_{vp} = resistance of said upper sensor without scaling;

$R_{vp'}$ = resistance of said upper sensor at the observed temperature when exposed to vapor only, scaled by dividing by the total number of increments; and

$R_{lq'}$ = resistance of said lower sensor at the observed temperature when exposed to liquid only, scaled by dividing by the total number of increments;

said processor being further programmed to calculate the vertical component of "1" for use as the basis for said generation of said elevation signal.

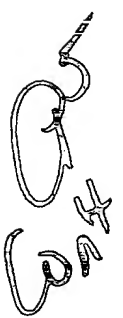

9. (Amended) A system as set forth in claim 1, wherein said heater is constituted by said sensor.

11. (Amended) A system for detecting the level of liquid in a vessel, comprising:

a detector assembly including a thermally conductive substrate,

a heater mounted on said substrate such that said heater is thermally coupled to the interior of the vessel, said heater being able to be actuated to add heat to the surface of the substrate thermally coupled to the interior of the vessel, and

upper, intermediate and lower sensors mounted on said substrate in proximity to said heater, said upper sensor being at a higher elevation relative to said lower sensor, said intermediate sensor being at an elevation between said upper and lower sensors, said upper and

lower sensors being thermally coupled to the interior of the vessel to detect the temperature therein in proximity to said upper and lower sensors, said upper and lower sensors being able to be actuated to generate respective electrical signals each defining a temperature signal indicative of said temperatures detected by said upper and lower sensors, said intermediate sensor being mounted on said substrate such that discrete elevations of the interior of the vessel are thermally coupled to corresponding longitudinal portions of said intermediate sensor to detect the temperature in the vessel in proximity to the sensor, said correspondence being incrementally continuous such that the elevations corresponding to said portions of said intermediate sensor increase from one to the other of the ends of said intermediate sensor, said intermediate sensor being able to be actuated to generate an electrical signal defining a temperature signal indicative of the temperature detected by said intermediate sensor, said intermediate sensor having a vertical dimension sufficiently large such that said temperature signal will vary in proportion to said longitudinal portion of said intermediate sensor thermally coupled to the liquid;

a processor electrically connected to each of said sensors for receiving said temperature signals after actuation of said heater, said processor being programmed to use said temperature signals to calculate the elevation of the upper surface of the liquid in the vessel thereby to generate an electrical signal defining an elevation signal indicative of the elevation of the liquid upper surface;

an interface electrically connected to said processor for receiving said elevation signal for use as the basis for communicating to the user the elevation of the liquid upper surface; and

a power supply electrically connected to said heater, intermediate sensor, lower sensor, upper sensor, processor, and interface, and

wherein said sensor comprises a potentiometer wherein the resistance to electrical conductivity of said sensor varies in proportion to the temperature detected by it, said temperature signal being equal to said resistance, said programming of said processor comprising using said temperature signal to measure said resistance of said sensor, said programming further comprising using said resistance to calculate the elevation of the liquid upper surface.

Please add new claims 13-17 as follows:

13. (New) A system for detecting the level of liquid in a vessel, comprising:

a detector assembly including a thermally conductive substrate;

a heater mounted on said substrate such that the heater is thermally coupled to the interior of the vessel, the heater being able to be actuated to add heat to the surface of the substrate thermally coupled to the interior of the vessel;

an elongated electrical resistance-type sensor mounted on the substrate in proximity to said heater such that discrete elevations of the interior of the vessel are thermally coupled to corresponding longitudinal portions of the

sensor to generate electrical signal defining a temperature signal at various elevations in the vessel, the longitudinal portions being incrementally continuous such that the elevations corresponding to the longitudinal portions increase along a length of the sensor, the sensor being able to be actuated to detect the temperature in the vessel at discrete elevations of the interior of the vessel at elevations where liquids in the vessel are thermally coupled to the liquid;

Q6
Cont
a processor electrically connected to the sensor for receiving the temperature signal after actuation of said heater, the processor being programmed to use the temperature signal to calculate the elevation of the upper surface of the liquid in the vessel to generate a further electrical signal defining an elevation signal indicative of the elevation of the upper surface of the liquid; and
an interface electrically connected to said processor for receiving said elevation signal to communicate to the user the elevation of the upper surface of the liquid.

14. (New) The system of claim 13 wherein a power supply is electrically connected to the heater, sensor, processor, and interface, and wherein said sensor comprises a variable resistance means wherein the resistance to electrical conductivity of the sensor varies in proportion to the temperature detected by it, the temperature signal being of a magnitude proportional to the magnitude of the resistance, the programming of said processor comprising using the temperature signal to measure said resistance of the sensor, the programming further comprising using the resistance to calculate to calculate the elevation of the liquid upper surface of the liquid.

15. (New) The system of claim 1 wherein the variable resistance means is a potentiometer.

16. (New) A method of detecting the level of liquid in a vessel, comprising:

providing a thermally conductive substrate to the

interior of a vessel to contain a liquid,

mounting a heater to the substrate such that the heater is

thermally coupled to the interior of the vessel, the

heater being able to be actuated to add heat to the

surface of the substrate thermally coupled to the

interior of the vessel;

mounting an elongated electrical resistance-type sensor the

substrate in proximity to the a heater mounted on said

substrate such that the heater is thermally coupled to

the interior of the vessel, the heater being able to be

actuated to add heat to the surface of the substrate

thermally coupled to the interior of the vessel;

electrically connecting a processor to the sensor for

receiving the temperature signal after actuation of said

heater, the processor being programmed to use the

temperature signal to calculate the elevation of the

upper surface of the liquid in the vessel to generate a

further electrical signal defining an elevation signal

indicative of the elevation of the upper surface of the

liquid; and

electrically connecting and interface to the processor for to

communicate to the user the elevation of the upper

surface of the liquid.

17. (New) The method of claim 16 wherein a power supply is electrically connected to the heater, sensor, processor, and interface, and wherein said sensor comprises a variable resistance means wherein the resistance to electrical conductivity of the sensor varies in proportion to the temperature detected by it, the temperature signal being of a magnitude proportional to the magnitude of the resistance, the programming of said processor comprising using the temperature signal to measure said resistance of the sensor, the programming further comprising using the resistance to calculate to calculate the elevation of the liquid upper surface of the liquid.
